US artifacts can be understood with a basic appreciation of the physical properties of the ultrasound beam, the propagation of sound in matter, and the assumptions of image processing. US artifacts arise secondary to errors inherent to the ultrasound beam characteristics, the presence of multiple echo paths, velocity errors, and attenuation errors.

Artifacts specific to DBT include blurring-ripple artifacts, truncation artifacts, and artifacts from loss of skin and superficial tissue resolution. Grid artifacts and patient motion artifacts seen at FFDM also can be present at DBT but rarely are appreciated because of the masking effect of out-of-plane blurring.
