Phosphoinositide 3-kinases in health and disease.

In the last decade, the availability of genetically modified animals has revealed interesting roles for phosphoinositide 3-kinases (PI3Ks) as signaling platforms orchestrating multiple cellular responses, both in health and pathology.

Phosphoinositide 3-kinase in Health and Disease

Class I phosphoinositide 3-kinases (PI3Ks) are a family of lipid kinases activated by cell membrane receptors, either receptor tyrosine kinases (RTKs) or G protein-coupled receptors (GPCRs), to catalyze the production of the lipid second messenger phosphatidylinositol (3,4,5)-trisphosphate (PIP3). T ...

The importance of the phosphoinositide 3-kinase (PI3K) signalling axis in a wide variety of normal and pathological responses is now well established. Most studies to date have focused on the acute alterations in PI3K activity induced by cell stimulation, and its impact on early downstream signalling by protein effectors of the PI3K lipids.

Background: Activated phosphoinositide 3-kinase δ syndrome (APDS) is a recently described combined immunodeficiency resulting from gain-of-function mutations in PIK3CD, the gene encoding the catalytic subunit of phosphoinositide 3-kinase δ (PI3K δ). Objective: We sought to review the clinical, immunologic, histopathologic, and radiologic features of APDS in a large genetically defined ...

The phosphoinositide 3-kinase (PI3K) pathway, a critical signal transduction system linking oncogenes and multiple receptor classes to many essential cellular functions, is perhaps the most commonly activated signaling pathway in human cancer. This pathway thus presents both an opportunity and a challenge for cancer therapy.

Phosphoinositide 3-kinases (PI3Ks) are a conserved family of kinases that phosphorylate phosphoinositides in the plasma membrane. These lipids function as second messengers in activating downstream signaling cascades that contribute to many biological processes such as cell growth and migration [12].
