A complete description of the Variable Orifice control is contained in YORK Service Manual 160.80- M1. An optional Hot Gas Bypass system allows the chiller to remain running during extreme light load conditions by diverting hot refrigerant gas directly from the Oil Separator to the Evaporator, bypassing the Condenser.

## **York maxe screw low discharge super heat**

The high-pressure fault of the chiller means that the compressor exhaust pressure is too high, which causes the high-pressure protection relay to operate. The compressor discharge pressure reflects the condensing pressure. The normal value should be 1.4 ~ 1.8MPa, and the protection value setting is recommended not to exceed 2.0MPa.

## **Causes And Solutions Of High Pressure Failures Of Chillers**

Additionally high pressure discharge can occur when the return condenser water, on a water cooled chiller, is returning from the cooling tower too hot. Check the cooling towers and make sure that the fans are working, the cooling tower bypass valves are properly aligned and that the water isn't just bypassing the cooling tower and returning ...
